Photobiomodulation Therapy

Photobiomodulation (PBM) therapy is a form of low dose light treatment that has been shown to reduce pain or inflammation and promote healing. PBM uses visible and near- infrared light to selectively inhibit pain receptors or promote resolution of inflammation. It is also able to stimulate the inherent tissue healing and regeneration responses in the body. It has been shown to improve muscle performance and joint motion, by reducing inflammation wherever the light is applied. Treatments typically take between 12 to 20 minutes and is repeated several times a week either in a light bed (NovoTHOR), canopy (Kerber USA), or hand-held PBM devices.

Known PBM benefits include:

- Improves overall wellness
- Improves athletic performance
- Temporarily relieves pain and soreness
- Reduces joint stiffness and improves mobility

CONTRAINDICATIONS FOR PHOTOBIMODULATION

Published research shows that there are no contraindications established currently to receive locally applied PBM treatments, following the manufacturer's User Instructions. Nonetheless, caution must be exercised with the following conditions, and generally the PBM Center will decline to permit use of a bed or canopy for persons in these categories:

PREGNANCY: Whole body PBM therapy should be avoided in pregnant women as the effects on developing fetus remains unknown. However, local PBM treatments may be used with caution on the pregnant woman as an adjunct to the other modalities to manage back pain or other complaints.

CARCINOMA: Direct PBM treatments on tumors are not recommended. However, application of PBM in other areas of pain is known to benefit supportive cancer care. Any PBM treatment must be performed in consultation with the oncologist, caregivers.

PHOTOSENSITIVITY REACTIONS: Some patients are known to be more photosensitive, and some drugs or natural remedies are known to exacerbate these reactions. A detailed history and careful observation after the first PBM session is recommended. In rare instances, even local treatment may be contraindicated.

RESTRICTIONS TO CONTINUING TREATMENTS: Some patients may report a number of sensations, such as localized feelings of warmth, tingling, or an increase or decrease in symptoms, nausea or dizziness within the 24-hour period immediately following PBM treatments. In patients with persistent or severe treatment reactions, immediate physician consultation and discontinuation of further sessions are recommended.

INHERENT RISKS IN ANY THERAPEUTIC EXERCISE: Any individual person can possibly incur an adverse reaction to any therapeutic activity, even if all instructions are followed carefully, because every human body has unique characteristics. Each client has to make an informed judgment of whether to accept that statistically remote risk.

PRE-SESSION INSTRUCTIONS

- It is very important that you use following recommendations for optimal benefits:
